

Convivo Data Model

I'm not sure who has the rights to associate a farmer with a washing station. (Does the washing station agent get to approve the farmer?) For now, this model assumes the farmer gets to choose.

It would make sense that the organic certifier gets to choose if the farm is certified or not, but the assignment spec implies that the user should be able to select a certifier in the farm create view, so here both classes can create the association.
